Platform Compatibility

The SonicOS 5.8.1.13 release is supported on the following SonicWALL Deep Packet Inspection (DPI) security appliances:

- SonicWALL TZ 105 / 105 Wireless
- SonicWALL TZ 205 / 205 Wireless

The SonicWALL WXA series appliances (WXA 500 Live CD, WXA 5000 Virtual Appliance, WXA 2000/4000 Appliances) are also supported for use with SonicWALL TZ products running 5.8.1.13. The minimum recommended firmware version for the WXA series appliances is 1.1.1.

Browser Support

SonicOS with Visualization uses advanced browser technologies such as HTML5, which are supported in most recent browsers. SonicWALL recommends using the latest Chrome, Firefox, Internet Explorer, or Safari browsers for administration of SonicOS.

This release supports the following Web browsers:

- Chrome 18.0 and higher (recommended browser for dashboard real-time graphics display)
- Firefox 16.0 and higher
- Internet Explorer 8.0 and higher (do not use compatibility mode)
- Safari 5.0 and higher

Mobile device browsers are not recommended for SonicWALL appliance system administration.

Known Issues

This section contains a list of known issues in the SonicOS 5.8.1.13 release.

3G/4G

Symptom	Condition / Workaround	Issue
The AT&T Velocity 3G device might not automatically reconnect after a warm restart with a TZ 105.	Occurs when an AT&T Velocity device is in use for the WAN connection and the firewall is rebooted without a power cycle. The device might not automatically reconnect after the appliance comes back up. Workaround : Power cycle the appliance to allow the device to reconnect.	130126
Customer cannot establish a connection using a Huawei E1750 3G modem (a supported device).	Occurs when trying to get an IP connection on port U0 or U1 using a Huawei E1750 which runs firmware later than 11.126.13.00.00.	123501

Bandwidth Management

Symptom	Condition / Workaround	Issue
When the Bandwidth Management (BWM) Global option is enabled, undefined queues can be selected without any warning that they are undefined, and the selected queue is then replaced with the default Medium queue when used in an Access Rule.	Occurs when a user selects a priority queue other than the default High, Medium, and Low queues without first defining the selected queue.	125706

Content Filtering

Symptom	Condition / Workaround	Issue
The YouTube for Schools feature is bypassed with iOS or Android wireless devices using the YouTube application.	Occurs when connecting an iOS or Android device to a wireless network that has YouTube for Schools filtering enabled. Use the YouTube application and see that all content is available for access.	121533

DPI-SSL

Symptom	Condition / Workaround	Issue
Excluding a User Object or User Group for Server DPI-SSL causes Client DPI-SSL to not work properly.	Occurs when accessing HTTPS websites from a client computer without logging in as a user on the client computer. Client DPI-SSL does not change the site certificate to the SonicWALL certificate.	118962

Global VPN Client (GVC)

Symptom	Condition / Workaround	Issue
A GVC connection cannot be established when using OCSP. The connection fails and the user gets the error message: "OCSP send request failed: status update verification in progress failed ! initCookie 0x13f4b71e603".	Occurs when a user attempts to connect using a GVC connection with a certificate, and Online Certificate Status Protocol (OCSP) is enabled in the WAN VPN Group.	126441
	Workaround : If OCSP is disabled, the GVC connects successfully with a certificate.	

Networking

Symptom	Condition / Workaround	Issue
Users cannot access the Internet when WXA web cache is enabled and RADIUS authentication is used.	Occurs when WXA is asked to authenticate a user using RADIUS. WXA requests are redirected to the login page.	124281
	Workaround : Admins who require user authentication and the WXA Web Cache enabled need to add a LAN -> LAN Firewall Policy for HTTP/Trusted Users. This still requires authentication when accessing local web servers.	
FTP or HTTP traffic cannot pass through a pair of interfaces configured in Wire Mode and set to Secure.	Occurs when using a Stateful High Availability pair and Active-Active DPI is enabled.	101359

SSL VPN

Symptom	Condition / Workaround	Issue
Java and ActiveX RDP Bookmarks do not work when connecting from a Windows 8 client.	Occurs when a user tries to connect to SSL VPN Virtual Office Bookmarks from a Windows 8 workstation. The user gets a bookmarks fail protocol error.	126736
Using the default SSL VPN NetExtender client, Windows 8 can connect to the SSL VPN server, but no route is configured on the client.	Occurs when the default NetExtender Windows Client (5.5.158) is installed on Windows 8. The client can connect to the SSL VPN server, but a NetExtender route cannot be configured.	123277

Wireless

Symptom	Condition / Workaround	Issue
The same SSID cannot be used on internal radio and VAP SonicPoints.	Occurs when setting the SSID on the internal radio, and then trying to create a VAP on the SonicPoint. A VAP is created when the SSID is set on the internal radio, therefore a VAP cannot be created on the SonicPoint with the same SSID because the SSID is used as the object name.	119621

1/1	DNI
V I	- / V

Symptom	Condition / Workaround	Issue
The tunnel interface is bound to X0, but IKE traffic is allowed on X1 through the remote firewall that is reachable on X1.	Occurs when trying to establish a tunnel interface VPN between two firewalls discovered by the router. When trying to connect Firewall1 X0 to Firewall2 X0, when the IPsec Phase2 security association (SA) is accepted, but the VPN is down, the policy is bound to X0. Although the remote firewall is reachable through X1, no IKE packet should go through the X1 interface in this configuration.	121966

Resolved Issues

The following issues are resolved in the SonicOS 5.8.1.13 release:

Firmware

Symptom	Condition / Workaround	Issue
The firewall may randomly reboot.	Occurs when running SonicOS 5.8.1.12 on a firewall which uses the L2TP Server associated with the WAN GroupVPN Policy.	130116 128271

Upgrading

Symptom	Condition / Workaround	Issue
A custom zone might be lost during a firmware upgrade and the remaining zones are displayed in alphabetical order. This can also cause deletions of other configurations that are associated with the lost zone, such as: interfaces, address objects, access rules and the policies.	Occurs when upgrading to SonicOS 5.8.1.11 or 5.8.1.12.	128483

VPN

Symptom	Condition / Workaround	Issue
A firewall may randomly reboot.	Occurs when the system is under a heavy load.	130331
The GMS login traffic for HTTPS management is dropped due to an enforced firewall rule.	Occurs when trying to acquire, in GMS using a Management Tunnel, a SonicWALL Firewall which was configured using SonicOS 5.8.1.12 factory defaults (not upgraded from earlier firmware versions).	130301

Wireless

Symptom	Condition / Workaround	Issue
 The following wireless appliances may have calibration issues: SonicPoint-N Series TZ 205 Wireless 	Occurs when trying to calibrate one of the mentioned wireless appliances.	130543

Supported Features

The following table lists the key features in SonicOS 5.8 and which appliance models support them.

Feature / Enhancement	TZ 105 Series	TZ 205 Series
Accept Multiple VPN Client Proposals	Supported	Supported
App Control Advanced	Supported	Supported
App Control Policy Configuration via App Flow Monitor		
App Rules	Supported	Supported
AppFlow > Flow Reporting		
AppFlow Dash		
AppFlow Monitor		
AppFlow Reports		
Application Usage and Risk Report		
Auto-Configuration of URLs to Bypass User Authentication	Supported	Supported
Browser NTLM Authentication	Supported	Supported
CASS 2.0	Supported	Supported
CFS Enhancements	Supported	Supported
Cloud GAV	Supported	Supported
Connection Monitor	Supported	Supported
Current Users and Detail of Users Options for TSR	Supported	Supported
Customizable Login Page	Supported	Supported
DHCP Scalability Enhancements	Supported	Supported
DPI-SSL		
Dynamic WAN Scheduling	Supported	Supported
Enhanced Connection Limit	Supported	Supported
Geo-IP Filtering and Botnet Command & Control Filtering		
Global BWM Ease of Use Enhancements	Supported	Supported
IKEv2	Supported	Supported
IPFIX & NetFlow Reporting		
LDAP Primary Group Attribute	Supported	Supported

Release Notes

Feature / Enhancement	TZ 105 Series	TZ 205 Series
Link Aggregation		
Log Monitor	Supported	Supported
Management Traffic Only Option for Network Interfaces	Supported	Supported
NTP Authentication Type	Supported	Supported
Packet Monitor Enhancements	Supported	Supported
Port Redundancy		
Preservation of Anti-Virus Exclusions After Upgrade	Supported	Supported
Real-Time Monitor		
SIP Application Layer Enhancements	Supported	Supported
SonicPoint Ne/Ni	Supported	Supported
SonicPoint VAPs	Supported	Supported
SonicPoint-N DR	Supported	Supported
SSL VPN NetExtender Client Update	Supported	Supported
SSO User Import from LDAP	Supported	Supported
Stateless High Availability		Supported
Top Global Malware		
User Monitor Tool	Supported	Supported
VLAN Subinterfaces	Supported	Supported
WAN Acceleration Support	Supported	Supported
Wire and Tap Mode		
Wireless Client Bridge Support	Supported	Supported
YouTube for Schools	Supported	Supported

Key Features in SonicOS 5.8

The following are the key features in SonicOS 5.8:

YouTube for School Content Filtering Support — YouTube for Schools is a service that allows for customized YouTube access for students, teachers, and administrators. YouTube Education (YouTube EDU) provides schools access to hundreds of thousands of free educational videos. These videos come from a number of respected organizations. You can customize the content available in your school. All schools get access to all of the YouTube EDU content, but teachers and administrators can also create playlists of videos that are viewable only within their school's network. Before configuring your SonicWALL security appliance for YouTube for Schools, you must first sign up: www.youtube.com/schools

The configuration of YouTube for Schools depends on the method of Content Filtering you are using, which is configured on the **Security Services > Content Filter** page.

Membership in Multiple Groups

- If a user is a member of multiple groups where one policy allows access to any part of YouTube and the other policy has a YouTube for Schools restriction, the user will be filtered by the YouTube for Schools policy and not be allowed unrestricted access to YouTube.
- A user cannot be a member of multiple groups that have different YouTube for School IDs. While the firewall will accept the configuration, this is not supported.

Note: For more information on the general configuration of CFS, refer to the **Security Services > Content Filter** section in the *SonicOS Administrator's Guide*.

Configuring YouTube for Schools as an App Control Policy

 When the CFS Policy Assignment drop-down menu is set to Via Application Control, YouTube for Schools is configured as an App Control Policy.

1.	Navigate to Firewall >	Match Objects	and click Add I	New Match Object.

Match Object Sett	ings			
Object Name:	CFS Allow YT4S			
Match Object Type:	CFS Allow/Forbidden List			
Match Type:	Partial Match			
Input Representation:	Alphanumeric Hexadecimal			
Content:	youtube.com	Add		
List:	youtube.com	Update		
	1g	Remove	•	
		Remove	All	
		Load From	File	
Ready				
		ОК	Cancel	Help

- 2. Type in a descriptive name, and then select CFS Allow/Forbidden List as the Match Object Type.
- 3. Select Partial Match for the Match Type.
- 4. In the **Content** field, type in "youtube.com" and then click **Add**.
- 5. Type in "ytimg.com" and then click Add.
- 6. Click **OK** to create the Match Object.

SonicOS 5.8.1.13 TZ 105/205 Series Release Notes P/N 232-002240-00 Rev A

7. Navigate to the Firewall > App Rules page and click Add New Policy.

App Control Policy Setting	5		
Policy Name:	CFS YouTube		
Policy Type:	CFS	•	•
Address:	Any	•]
Exclusion Address:	None	•]
Match Object:	CFS-Any	•]
Action Object:	CFS block page	•]
	Included:		Exduded:
Users/Groups:	All	•	None 👻
Schedule:	Always on	•	
Enable flow reporting:			
Enable Logging:			
Log using CFS message format:			
Log Redundancy Filter (seconds):	Use Global Settings		
Zone:	Any 👻		
CFS Allow/Excluded List:	CFS Allow YT4S	•]
CFS Forbidden/Included List:	None	-	
Enable Safe Search Enforcement:			
Enable YouTube for Schools:			
School ID:	uflGb16ejHSRXqXnnnK2Jg]
Note: BWM Type: Advanced; To ch	ange go to Firewall Settings > BWM		
Ready			
			OK Cancel Help

- 8. Type in a descriptive **Policy Name**.
- 9. For the **Policy Type**, select **CFS**.
- 10. Select the appropriate settings for Match Object and Action Object, based on your environment.
- 11. For **CFS Allow/Excluded List**, select the Match Object you just created (our example uses "CFS Allow YT4S").
- 12. Select the Enable YouTube for Schools checkbox.
- 13. Paste in your School ID, which is obtained from www.youtube.com/schools
- 14. Click **OK** to create the policy.

NOTE: Once the policy has been applied, any existing browser connections will be unaffected until the browser has been closed and reopened. Also, if you have a browser open as administrator on the firewall, you will be excluded from CFS policy enforcement unless you configure the firewall specifically not to exclude you (select the **Do not bypass CFS blocking for the Administrator** checkbox on the **Security Services > Content Filter** page).

SonicOS 5.8.1.13 TZ 105/205 Series Release Notes P/N 232-002240-00 Rev A

Configuring YouTube for Schools as a Content Filter Policy

- When the **CFS Policy Assignment** drop-down menu is set to **Via User and Zone Screens**, YouTube for Schools is configured as part of the Content Filter policy.
 - 1. On the Security Services > Content Filter page, select Content Filter Service for the Content Filter Type drop-down menu.
 - 2. Click the **Configure** button.
 - 3. On the **Policy** tab, click the **Configure** icon for the CFS policy on which you want to enable YouTube for Schools.
 - 4. Click on the Settings tab, and select the Enable YouTube for Schools checkbox.
 - 5. Paste in your School ID, which is obtained from www.youtube.com/schools.

Policy	URL List	Settings	Custom List
Custom List Setting	gs		
Source of Allowed Domai	ns:	Glo	bal 💌
Source of Forbidden Dom	nains:	Glo	bal 💌
Source of Keyword:		Glo	bal 💌
Enable Safe Sea	rch Enforcement		-
School ID Lj3Q2GVa	or Schools Hbr3k_yiY2lhkQ		1
Filter Forbidden U	IRLs by time of day		
Always on	•		

- 6. Click OK.
- 7. On the Custom List tab, click the Add button for Allowed Domains.
- 8. In the dialog box, type "youtube.com" into the **Domain Name** field and click **OK**.
- 9. Click Add again.

10. Type "ytimg.com" into the Domain Name field and click OK.

Allowed Domains	s		Forb	oidden Domains		
Add Ec	dit Delete	Delete All	A	dd Edit	Delete	Delete All
Keyword Blockin	ıg					

11. Click OK.

These settings will override any CFS category that blocks YouTube.

NOTE: Once the policy has been applied, any existing browser connections will be unaffected until the browser has been closed and reopened. Also, if you have a browser open as administrator on the firewall, you will be excluded from CFS policy enforcement unless you configure the firewall specifically not to exclude you (select the **Do not bypass CFS blocking for the Administrator** checkbox on the **Security Services > Content Filter** page).

• **IKEv2 Support** — Beginning in SonicOS 5.8.1.8, Internet Key Exchange version 2 (IKEv2) is the default proposal type for new Site-to-Site VPN policies when clicking the Add button from the VPN > Settings screen.

IKEv2 is a protocol for negotiating and establishing a security association (SA). IKEv2 provides improved security and a simplified architecture. Compared to IKEv1 Main Mode, using IKEv2 greatly reduces the number of message exchanges needed to establish an SA, while IKEv2 is more secure and flexible than IKEv1 Aggressive Mode. This reduces the delays during re-keying.

IPsec Secondary Gateway is supported with IKEv2. DHCP over VPN is not supported with IKEv2. IKEv2 is not compatible with IKEv1. When IKEv2 is used, all nodes in the VPN must use IKEv2 to establish the tunnels.

IKEv2 has the following advantages over IKEv1:

- o More secure
- o More reliable
- o Simpler
- o Faster
- o Extensible
- Fewer message exchanges to establish connections
- EAP Authentication support
- MOBIKE support
- Built-in NAT traversal
- o Keep Alive is enabled as default
- SNMP for VLAN Interfaces In SonicOS 5.8.1.12 and higher, SNMP MIB-II statistic counters are supported for VLAN interfaces.

SonicOS 5.8.1.13 TZ 105/205 Series Release Notes P/N 232-002240-00 Rev A

 SonicOS Web-based Management Interface — HTTP access to the SonicOS web-based management interface is disabled by default. When running SonicOS with factory defaults, the administrator can log into the management interface using HTTPS at <u>https://192.168.168.168</u>.

HTTP management is still allowed when upgrading from prior firmware versions, when already enabled in the previous configuration settings.

Note: HTTP management must be enabled when the firewall is being managed by SonicWALL GMS via a VPN tunnel. This applies when using either a GMS Management Tunnel or an existing VPN tunnel.

The System > Administration page has a new **Allow management via HTTP** checkbox to allow the administrator to enable/disable HTTP management globally.

Web Management Settings			
Allow management via HTTP			
HTTP Port:	80	Delete cookies	
HTTPS Port:	443	End config. mode	
Certificate Selection:	Use Selfsigned Certificate		
Certificate Common Name:	192.168.168.168		
Default Table Size:	50 items per page		
Auto-updated Table Refresh Interval: 10 in seconds			
Use System Dashboard View as s	starting page		
Enable Tooltip			
Form Tooltip Delay: 2000	in msecs		
Button Tooltip Delay: 3000	in msecs		
Text Tooltip Delay: 500	in msecs		

- Application Intelligence + Control—This feature has two components for more network security:
 - (a) Identification: Identify applications and track user network behaviors in real-time.
 - (b) Control: Allow/deny application and user traffic based on bandwidth limiting policies.

Administrators can easily create network policy object-based control rules to filter network traffic flows based on:

- o Blocking signature-matching Applications, which are notoriously dangerous and difficult to enforce
- o Viewing the real-time network activity of trusted Users and User Groups and guest services
- Matching **Content-rated categories**

Network security administrators now have application-level, user-level, and content-level real-time visibility into the traffic flowing through their networks. Administrators can take immediate action to re-traffic engineer their networks, quickly identify Web usage abuse, and protect their organizations from infiltration by malware. Administrators can limit access to bandwidth-hogging websites and applications, reserve higher priority to critical applications and services, and prevent sensitive data from escaping the SonicWALL secured networks.

New appliances running SonicOS 5.8 receive an automatic 30-day free trial for App Control upon registration.

SonicWALL appliances upgrading from a pre-SonicOS 5.8 release **and** already licensed for GAV/IPS/AS, Total Secure, or Comprehensive Gateway Security Suite (CGSS) automatically receive a complimentary App Control license, required for creating Application Control policies.

Select the **Enable App Control** option on the Firewall > App Control Advanced page to begin using the App Control feature.

App Control Global Settings	
Enable App Control	
Configure App Control Settings	Reset App Control Settings & Policies

To create policies using App Rules (included with the App Control license), select **Enable App Rules** on the Firewall > App Rules page.

- **Global Bandwidth Management**—Global Bandwidth Management improves ease of use for bandwidth management (BWM) configuration, and increases throughput performance of managed packets for ingress and egress traffic on all interfaces, not just WAN. The new Firewall Settings > BWM page allows network administrators to specify guaranteed minimum bandwidth, maximum bandwidth, and control the number of different priority levels for traffic. These global settings are used in firewall access rules and application control policies. Global BWM provides:
 - o Simple bandwidth management on all interfaces.
 - o Bandwidth management of both ingress and egress traffic.
 - Support for specifying bandwidth management priority per firewall rules and application control rules.
 - o Default bandwidth management queue for all traffic.

Global bandwidth management provides 8 priority queues, which can be applied to each physical interface. The **Firewall Settings > BWM** page has usability enhancements. An **Interface BWM Settings** tooltip displays all network interfaces and shows whether bandwidth management is enabled for them.

Firewall Settings /				
BWM				
Accept Ca	ncel	Restore Defaults.		
Bandwidth Manageme Inteface BWM Settings	nt Type	e: © WAN © Glo Interface Ba	bal © None ndwidth Settings	
	Nam	e Ingress	Egress	
Priority	XO	Disabled	Disabled	Maximum\Burst
· · · · · · · · · · · · · · · · · · ·	X1	Enabled / 10000 K	bps Enabled / 10000 Kbps	i laxinan (barse
0 Realtime	X2	Disabled	Disabled %	100 %
4 Babaat	Х3	Disabled	Disabled	100 06
1 Hignest	X4	Disabled	Disabled	100 %0
2 High	X5	Disabled	Disabled %	100 %
2. Madium Ulab	UO	Disabled	Disabled	100 96
5 Medium nign	U1	Disabled	Disabled	100 90
4 Medium		E	50 %	100 %
5 Medium Low			0 %	100 %

You can select either WAN or Global as the Bandwidth Management Type.

Note: When switching between bandwidth management modes, all bandwidth management settings in firewall access rules are set back to defaults and any custom settings must be reconfigured. Default BWM actions in Application Control policies are automatically converted to WAN BWM or Global BWM, using default priority levels.

The following note is displayed at the bottom of the **Firewall Settings > BWM** page:

Note: This priority table is used only when global bandwidth management is selected. (When using legacy BWM, values can be set independently in Firewall Access Rules and Action Objects.)

In global BWM mode, all traffic (by default) is marked as "medium" priority unless configured via firewall rule/app firewall rule.

In the global priority queue table, you can configure the **Guaranteed** and **Maximum\Burst** rates for each **Priority** queue. The rates are specified as a percentage. The actual rate is determined dynamically while applying BWM on an interface. The configured bandwidth on an interface is used in calculating the absolute value. The sum of all guaranteed bandwidth must not exceed 100%, and guaranteed bandwidth must not be greater than maximum bandwidth per queue.

• **Bandwidth Management Monitor Page** — The BWM Monitor page displays per-interface bandwidth management for ingress and egress network traffic. The BWM monitor graphs are available for real-time, highest, high, medium high, medium, medium low, low and lowest policy settings. The view range is configurable in 60 seconds, 2 minutes, 5 minutes, and 10 minutes (default). The refresh interval rate is configurable from 3 to 30 seconds. The bandwidth management priority is depicted by guaranteed, maximum, and dropped.

The **Dashboard > BWM Monitor** page displays a chart for each possible BWM setting for the selected interface, and displays **[Disabled]** unless BWM is enabled.

Dashboard /						
BWM	Monitor					
			To configu	re Global BWM, please go t	o Firewall Settings > E	3WM. 13:52:28 Feb 13
X1 (I/E)	▼ ? Refresh every: 5 sec.	View Range:	10 minutes 💌		- Guaranteed -	- Maximum

In each chart, an information box now shows the values for **Current** bandwidth, **Dropped** bandwidth, **Guaranteed** bandwidth, and **Max** bandwidth for the interface selected at the top of the page.

SonicOS 5.8.1.13 TZ 105/205 Series Release Notes P/N 232-002240-00 Rev A

WAN Acceleration— SonicOS 5.8.1.0 and higher, the WAN Acceleration service allows network administrators to accelerate WAN traffic between a central site and a branch site by using Transmission Control Protocol (TCP), Windows File Sharing (WFS), and a Web Cache. The Dell SonicWALL WXA series appliance is deployed in conjunction with a Dell SonicWALL TZ series appliance. In this type of deployment, the TZ series appliance provides dynamic security services, such as attack prevention, Virtual Private Network (VPN), routing, and Web Content Filtering. The WAN Acceleration service can increase application performance.

WXA 1.2 Support—SonicOS 5.8.1.12 and higher supports SonicWALL WXA 1.2, which contains several enhancements over WXA 1.1.1:

 Unsigned SMB Acceleration—In previous versions of WXA, SMB signing was the only supported method for shared access to files, which required joining the WXA series appliance to the domain and manually configuring shares. However, some networks do not need to use SMB signing. For these types of network environments, WXA 1.2 introduces support for Unsigned SMB, which allows the WXA series appliance to accelerate traffic without joining the domain. This greatly simplifies the configuration procedure for WFS Acceleration. Just click the Unsigned SMB checkbox, apply the changes, and shared files start accelerating between sites.

If your network uses unsigned and signed SMB traffic, the **Unsigned SMB** and **Support SMB Signing** checkboxes can be enabled to use both features simultaneously.

- **Web Cache**—The Web Cache feature stores copies of frequently and recently requested Web content as it passes through the network. When a user requests this Web content, it is retrieved from the local web cache instead of the Internet, which can result in significant reductions in downloaded data and bandwidth usage.
- **YouTube Web Caching**—The Web Cache feature also provides caching for YouTube content. This feature is only available when using Moderate (default) and Aggressive web caching strategies.

For more information about WAN Acceleration and these WXA 1.2 features, see the WXA 1.2 User's Guide.

• SonicPoint-N Dual Radio Support—The SonicWALL SonicPoint-N Dual Radio appliance (SonicPoint-N DR) is supported by all SonicWALL NSA and TZ platforms when running SonicOS 5.8.0.3 or higher.

With support for two wireless radios at the same time, you can use **SonicPoint-N DR Clean Wireless** access points to create an enterprise-class secure wireless network. The SonicPoint-N DR uses six antennas to communicate with wireless clients on two frequency ranges: 2.4 GHz and 5 GHz. You can install and configure a SonicPoint-N DR access point in about an hour.

Note: The SonicPoint-N DR cannot broadcast the same Service Set Identifiers (SSID) when using Virtual Access Points (VAP) on 2.4 and 5 Ghz frequency ranges.

For more information, see the *SonicWALL SonicPoint-N DR Getting Started Guide*, at: <u>http://www.sonicwall.com/app/projects/file_downloader/document_lib.php?t=PG&id=444</u>

• Accept Multiple Proposals for Clients Option—The Accept Multiple Proposals for Clients checkbox allows multiple VPN or L2TP clients using different security policies to connect to a firewall running SonicOS 5.8.0.3 or higher

The option is on the **Advanced** tab when configuring a GroupVPN policy from the **VPN > Settings** page in SonicOS.

General	Proposals	Advanced	Client
Advanced Setti	ngs		
Enable Window	s Networking (NetBIC	DS) Broadcast	
Enable Multicas	t	-,	
Accept Multiple	Proposals for Clients	i.	

The client policy is still strictly checked against the configured proposal in the Proposals tab, as with clients connecting with SonicWALL GVC. This option has no effect on GVC.

If the **Accept Multiple Proposals for Clients** option is selected, SonicOS will allow connections from other L2TP clients, such as Apple OS, Windows, or Android clients whose offered proposal is different from what is configured on the Proposals tab. The proposal is accepted if it meets the following conditions:

- o If the offered algorithm matches one of the possible algorithms available in SonicOS.
- o If the offered algorithm is stronger and more secure than the configured algorithm in the SonicOS proposal.

If this option is not selected, SonicOS will require the client to strictly match the configured policy.

This option allows SonicWALL to support heterogeneous environments for Apple, Windows, and Android clients. Using this option, SonicOS can work with these clients if their proposal includes a combination of algorithms which are supported in SonicOS, but are not configured in the policy to prevent other clients like GVC from failing.

SonicOS 5.8.1.13 TZ 105/205 Series Release Notes P/N 232-002240-00 Rev A

- Auto-Configuration of URLs to Bypass User Authentication—Beginning in 5.8.1.0, SonicOS includes an auto-configuration utility to temporarily allow traffic from a single, specified IP address to bypass authentication. The destinations that traffic accesses are then recorded and used to allow that traffic to bypass user authentication. Typically this is used to allow traffic such as anti-virus updates and Windows updates. To use this feature, navigate to Users > Settings and click the Auto-configure button in the Other Global User Settings section.
- **Comprehensive Anti-Spam Service (CASS) 2.0**—The Comprehensive Anti-Spam Service (CASS) feature provides a quick, efficient, and effective way to add anti-spam, anti-phishing, and anti-virus capabilities to your SonicWALL security appliance. This feature increases the efficiency of your SonicWALL security appliance by providing you the ability to configure user view settings and filter junk messages before users see it in their inboxes. The following capabilities are available with CASS 2.0:
 - The Email Security Junk Store application can reside outside the Exchange Server system, such as on a remote server.
 - Dynamic discovery of Junk Store user interface pages feature allows the Junk Store to inform SonicOS of a list of pages to display under Anti-Spam in the SonicOS left hand navigation pane. For example, the pane might show Junk Box View, Junk Box Settings, Junk Summary, User View Setup, and/or Address Books.
 - User-defined Allow and Deny Lists can be configured with FQDN and Range address objects in addition to Host objects.
 - A GRID IP Check tool is available in the Anti-Spam > Status page. The SonicWALL administrator can specify (on-demand) an IP address to check against the SonicWALL GRID IP server. The result will either be LISTED or UNLISTED. Connections from a LISTED host will be blocked by the SonicWALL security appliance running CASS (unless overridden in the Allow List).
 - A parameter to specify the Probe Response Timeout is available in the Anti-Spam > Settings page Advanced Options section. This option supports deployment scenarios where a longer timeout is needed to prevent a target from frequently being marked as Unavailable. The default value is 30 seconds.
- **Content Filtering Enhancements**—The CFS enhancements provide policy management of network traffic based on Application usage, User activity, and Content type. Administrators can create multiple CFS policies per user group and set restrictive 'Bandwidth Management Policies' based on CFS categories.
- DHCP Scalability Enhancements—The DHCP server in SonicWALL appliances has been enhanced to provide between 2 to 4 times the number of leases previously supported. To enhance the security of the DHCP infrastructure, the SonicOS DHCP server now provides server side conflict detection to ensure that no other device on the network is using the assigned IP address. Conflict detection is performed asynchronously to avoid delays when obtaining an address.
- **Dynamic WAN Scheduling**—SonicOS 5.8 supports scheduling to control when Dynamic WAN clients can connect. A Dynamic WAN client connects to the WAN interface and obtains an IP address with the PPPoE, L2TP, or PPTP. This enhancement allows the administrator to bind a schedule object to Dynamic WAN clients so that they can connect when the schedule allows it and they are disconnected at the end of the configured schedule. In the SonicOS management interface, a Schedule option is available on the WAN interface configuration screen when one of the above protocols is selected for IP Assignment. Once a schedule is applied, a log event is recorded upon start and stop of the schedule.
- Enhanced Connection Limiting—Connection Limiting enhancements expand the original Connection Limiting feature which provided global control of the number of connections for each IP address. This enhancement is designed to increase the granularity of this kind of control so that the SonicWALL administrator can configure connection limitation more flexibly. Connection Limiting uses Firewall Access Rules and Policies to allow the administrator to choose which IP address, which service, and which traffic direction when configuring connection limiting.

- Gateway Anti-Virus Enhancements (Cloud GAV)—The Cloud Gateway Anti-Virus feature introduces an advanced malware scanning solution that compliments and extends the existing Gateway AV scanning mechanisms present on SonicWALL firewalls to counter the continued growth in the number of malware samples in the wild. Cloud Gateway Anti-Virus expands the Reassembly Free Deep Packet Inspection engine capabilities by consulting with the data center based malware analysis servers. This approach keeps the foundation of RFDPI-based malware detection by providing a low-latency, real-time solution that is capable of scanning unlimited numbers of files of unlimited size on all protocols that are presently supported without adding any significant incremental processing overhead to the appliances themselves. With this additional layer of security, SonicWALL's Next Generation Firewalls are able to extend their current protection to cover multiple millions of pieces of malware.
- LDAP Primary Group Attribute—To allow Domain Users to be used when configuring policies, membership of the Domain Users group can be looked up via an LDAP "Primary group" attribute. Beginning in 5.8.1.0, SonicOS provides an attribute setting in the LDAP schema configuration for using this feature.
- Management Traffic Only Option for Network Interfaces—Beginning in 5.8.1.0, SonicOS provides a Management Traffic Only option on the Advanced tab of the interface configuration window, when configuring an interface from the Network > Interfaces page. When selected, this option prioritizes all traffic arriving on that interface. The administrator should enable this option ONLY on interfaces intended to be used exclusively for management purposes. If this option is enabled on a regular interface, it will still prioritize the traffic, but that may not be the desired result. It is up to the administrator to limit the traffic to just management; the firmware does not have the ability to prevent pass- through traffic.

The purpose of this option is to provide the ability to access the SonicOS management interface even when the appliance is running at 100% utilization.

- NTLM Authentication with Mozilla Browsers—As an enhancement to Single Sign-On, SonicOS can now use NTLM authentication to identify users who are browsing using Mozilla-based browsers (including Internet Explorer, Firefox, Chrome and Safari). NTLM is part of a browser authentication suite known as "Integrated Windows Security" and should be supported by all Mozilla-based browsers. It allows a direct authentication request from the SonicWALL appliance to the browser with no SSO agent involvement. NTLM authentication works with browsers on Windows, Linux and Mac PCs, and provides a mechanism to achieve Single Sign-On with Linux and Mac PCs that are not able to interoperate with the SSO agent.
- **NTP Authentication Type**—When adding a Network Time Protocol server, the Add NTP Server dialog box provides a field to specify the NTP authentication type, such as MD5. Fields are also available to specify the trust key ID, the key number and the password.
- **Preservation of Anti-Virus Exclusions After Upgrade**—Beginning in 5.8.1.0, SonicOS includes the ability to detect if the starting IP address in an existing range configured for exclusion from anti-virus enforcement belongs to either LAN, WAN, DMZ or WLAN zones. After upgrading to a newer firmware version, SonicOS applies the IP range to a newly created address object. Detecting addresses for other zones not listed above, including custom zones, is not supported.
- Single Sign-On Import Users from LDAP Option—An Import from LDAP button on the Users > Local Users page allows you to configure local users on the SonicWALL by retrieving the user names from your LDAP server. This allows SonicWALL user privileges to be granted upon successful LDAP authentication. For ease of use, options are provided to reduce the list to a manageable size and then select the users to import.

• SIP Application Layer Gateway Enhancements—SIP operational and scalability enhancements are provided in SonicOS 5.8. The SIP feature-set remains equivalent to previous SonicOS releases, but provides drastically improved reliability and performance. The SIP Settings section under the VoIP > Settings page is unchanged.

SIP ALG support has existed within SonicOS firmware since very early versions on legacy platforms. Changes to SIP ALG have been added over time to support optimized media between phones, SIP Back-to-Back User Agent (B2BUA), additional equipment vendors, and operation on a multi-core system.

The SIP protocol is now in a position of business critical importance – protecting the voice infrastructure, including VoIP. To accommodate the demands of this modern voice infrastructure, SIP ALG enhancements include the following:

- SIP Endpoint Information Database The algorithm for maintaining the state information for known endpoints is redesigned to use a database for improved performance and scalability. Endpoint information is no longer tied to the user ID, allowing multiple user IDs to be associated with a single endpoint. Endpoint database access is flexible and efficient, with indexing by NAT policy as well as by endpoint IP address and port.
- Automatically Added SIP Endpoints User-configured endpoints are automatically added to the database based on user-configured NAT policies, providing improved performance and ensuring correct mappings, as these endpoints are pre-populated rather than "learnt."
- **SIP Call Database** A call database for maintaining information about calls in progress is implemented, providing improved performance and scalability to allow SonicOS to handle a much greater number of simultaneous calls. Call database entries can be associated with multiple calls.
- **B2BUA Support Enhancements** SIP Back-to-Back User Agent support is more efficient with various algorithm improvements.
- Connection Cache Improvements Much of the data previously held in the connection cache is offloaded to either the endpoint database or the call database, resulting in more efficient data access and corollary performance increase.
- **Graceful Shutdown** Allows SIP Transformations to be disabled without requiring the firewall to be restarted or waiting for existing SIP endpoint and call state information to time out.
- SonicPoint Virtual Access Point Support for TZ Series—Virtual Access Points (VAPs) are supported when one or more SonicWALL SonicPoints are connected to a SonicWALL TZ 105/205 Series appliance.

Anti-virus exclusions which existed before the upgrade and which apply to hosts residing in custom zones will not be detected. IP address ranges not falling into the supported zones will default to the LAN zone. Conversion to the LAN zone occurs during the restart process. There is no message in the SonicOS management interface at login time regarding the conversion.

- SSL VPN NetExtender Update—This enhancement supports password change capability for SSL VPN users, along with various fixes. When the password expires, the user is prompted to change it when logging in via the NetExtender client or SSL VPN portal. It is supported for both local users and remote users (RADIUS and LDAP).
- VLAN Support for TZ Series—SonicOS 5.8 provides VLAN support for SonicWALL TZ 105/205 Series appliances, including wireless models.

Upgrading SonicOS Image Procedures

The following procedures are for upgrading an existing SonicOS image to a newer version:

Obtaining the Latest SonicOS Image Version	
Saving a Backup Copy of Your Configuration Preferences	
Upgrading a SonicOS Image with Current Preferences	
Importing Preferences to SonicOS 5.8	
Importing Preferences from SonicOS Standard to SonicOS 5.8 Enhanced	
Support Matrix for Importing Preferences	24
Upgrading a SonicOS Image with Factory Defaults	24
Using SafeMode to Upgrade Firmware	25

Obtaining the Latest SonicOS Image Version

To obtain a new SonicOS firmware image file for your SonicWALL security appliance:

- 1. Connect to your mysonicwall.com account at <u>http://www.mysonicwall.com</u>.
- 2. Copy the new SonicOS image file to a directory on your management station.

You can update the SonicOS image on a SonicWALL security appliance remotely if the LAN interface or the WAN interface is configured for management access.

Saving a Backup Copy of Your Configuration Preferences

Before beginning the update process, make a system backup of your SonicWALL security appliance configuration settings. The backup feature saves a copy of your current configuration settings on your SonicWALL security appliance, protecting all your existing settings in the event that it becomes necessary to return to a previous configuration state.

In addition to using the backup feature to save your current configuration settings to the SonicWALL security appliance, you can export the configuration preferences file to a directory on your local management station. This file serves as an external backup of the configuration preferences, and can be imported back into the SonicWALL security appliance.

Perform the following steps to save a backup of your configuration settings and export them to a file on your local management station:

- 1. On the System > Settings page, click **Create Backup**. Your configuration preferences are saved. The System Backup entry is displayed in the Firmware Management table.
- 2. To export your settings to a local file, click **Export Settings**. A popup window displays the name of the saved file.
- 3. On the System > Diagnostics page, under Tech Support Report, select the following checkboxes and then click the **Download Report** button:
 - VPN Keys
 - ARP Cache
 - DHCP Bindings
 - IKE Info
 - SonicPointN Diagnostics
 - Current users
 - Detail of users

The information is saved to a "techSupport_" file on your management computer.

Upgrading a SonicOS Image with Current Preferences

Perform the following steps to upload new firmware to your SonicWALL appliance and use your current configuration settings upon startup:

- 1. Download the SonicOS firmware image file from mysonicwall.com and save it to a location on your local computer.
- 2. On the System > Settings page, click **Upload New Firmware**.
- 3. Browse to the location where you saved the SonicOS firmware image file, select the file, and click Upload.
- 4. On the System > Settings page, click the **Boot** icon in the row for **Uploaded Firmware**.
- 5. In the confirmation dialog box, click **OK**. The SonicWALL restarts and then displays the login page.
- 6. Enter your user name and password. Your new SonicOS image version information is listed on the **System** > **Settings** page.

Importing Preferences to SonicOS 5.8

Preferences importing to the SonicWALL network security appliances is generally supported from the following SonicWALL appliances running SonicOS:

- NSA Series
- NSA E-Class Series
- TZ 215/210//205/200//105/100/190/180/170 Series
- PRO Series

There are certain exceptions to preferences importing on these appliances running the SonicOS 5.8 release. Preferences cannot be imported in the following cases:

- Settings files containing Portshield interfaces created prior to SonicOS 5.x
- Settings files containing VLAN interfaces are not accepted by the TZ 100/200 Series firewalls
- Settings files from a PRO 5060 with optical fiber interfaces where VLAN interfaces have been created

Full support for preferences importing from these appliances is targeted for a future release. At that time, you will need to upgrade your firmware to the latest SonicOS maintenance release available on MySonicWALL.

Importing Preferences from SonicOS Standard to SonicOS 5.8 Enhanced

The SonicOS Standard to Enhanced Settings Converter is designed to convert a source Standard Network Settings file to be compatible with a target SonicOS Enhanced appliance. Due to the more advanced nature of SonicOS Enhanced, its Network Settings file is more complex than the one SonicOS Standard uses. They are not compatible. The Settings Converter creates an entirely new target Enhanced Network Settings file based on the network settings found in the source Standard file. This allows for a rapid upgrade from a Standard deployment to an Enhanced one with no time wasted in re-creating network policies. **Note**: SonicWALL recommends deploying the converted target Network Settings file in a testing environment first and always keeping a backup copy of the original source Network Settings file.

The SonicOS Standard to Enhanced Settings Converter is available at: https://convert.global.sonicwall.com/

If the preferences conversion fails, email your SonicOS Standard configuration file to <u>settings_converter@sonicwall.com</u> with a short description of the problem. In this case, you may also consider manually configuring your SonicWALL appliance.

To convert a Standard Network Settings file to an Enhanced one:

- 1. Log in to the management interface of your SonicOS Standard appliance, navigate to **System > Settings**, and save your network settings to a file on your management computer.
- 2. On the management computer, point your browser to <u>https://convert.global.sonicwall.com/</u>.
- 3. Click the Settings Converter button.

4. Log in using your MySonicWALL credentials and agree to the security statement.

The source Standard Network Setting file must be uploaded to MySonicWALL as part of the conversion process. The Setting Conversion tool uses MySonicWALL authentication to secure private network settings. Users should be aware that SonicWALL will retain a copy of their network settings after the conversion process is complete.

- 5. Upload the source Standard Network Settings file:
 - Click Browse.
 - Navigate to and select the source SonicOS Standard Settings file.
 - Click Upload.
 - Click the right arrow to proceed.
- 6. Review the source SonicOS Standard Settings Summary page.

This page displays useful network settings information contained in the uploaded source Network Settings file. For testing purposes, the LAN IP and subnet mask of the appliance can be changed on this page in order to deploy it in a testing environment.

- (Optional) Change the LAN IP address and subnet mask of the source appliance to that of the target appliance.
- Click the right arrow to proceed.
- 7. Select the target SonicWALL appliance for the Enhanced deployment from the available list.

SonicOS Enhanced is configured differently on various SonicWALL appliances, mostly to support different interface numbers. As such, the converted Enhanced Network Settings file must be customized to the appliance targeted for deployment.

- 8. Complete the conversion by clicking the right arrow to proceed.
- 9. Optionally click the **Warnings** link to view any differences in the settings created for the target appliance.
- 10. Click the **Download** button, select Save to Disk, and click OK to save the new target SonicOS Enhanced Network Settings file to your management computer.
- 11. Log in to the management interface for your SonicWALL appliance.
- 12. Navigate to **System > Settings**, and click the **Import Settings** button to import the converted settings to your appliance.

Notes:

- A When VLANs are present, the settings file will not be accepted.
- B Portshield interfaces prior to SonicOS 5.x are not supported.
- C Configuration information from extra interfaces will be removed. NAT policies, Firewall access rules, and other interface-dependent configuration will also be removed.
- D When importing from non-SonicOS 5.x devices, the X2 interface will be configured in the DMZ zone.
- E VLANs created as sub-interfaces of the fiber interfaces will be renamed.

Unsupported. While importing the settings file may be successful, firewall limitations may result in the removal of items such as DHCP scopes, VPN settings, etc.

Upgrading a SonicOS Image with Factory Defaults

Perform the following steps to upload new firmware to your SonicWALL appliance and start it up using the default configuration:

- 1. Download the SonicOS firmware image file from mysonicwall.com and save it to a location on your local computer.
- 2. On the System > Settings page, click Create Backup.
- 3. Click Upload New Firmware.
- 4. Browse to the location where you saved the SonicOS firmware image file, select the file, and click Upload.
- 5. On the System > Settings page, click the **Boot** icon in the row for **Uploaded Firmware with Factory Default Settings**.
- 6. In the confirmation dialog box, click **OK**. The SonicWALL restarts and then displays the Setup Wizard, with a link to the login page.
- 7. Enter the default user name and password (admin / password) to access the SonicWALL management interface.

Using SafeMode to Upgrade Firmware

The SafeMode procedure uses a reset button in a small pinhole, whose location varies: on the NSA models, the button is near the USB ports on the front; on the TZ models, the button is next to the power cord on the back. If you are unable to connect to the SonicWALL security appliance's management interface, you can restart the SonicWALL security appliance in SafeMode. The SafeMode feature allows you to quickly recover from uncertain configuration states with a simplified management interface that includes the same settings available on the System > Settings page.

To use SafeMode to upgrade firmware on the SonicWALL security appliance, perform the following steps:

- 1. Connect your computer to the X0 port on the SonicWALL appliance and configure your IP address with an address on the 192.168.168.0/24 subnet, such as 192.168.168.20.
- 2. Do one of the following to restart the appliance in SafeMode:
 - Use a narrow, straight object, like a straightened paper clip or a toothpick, to press and hold the reset button on the front of the security appliance for more than 20 seconds.
 - Use the LCD control buttons on the front bezel to set the appliance to Safe Mode. Once selected, the LCD displays a confirmation prompt. Select **Y** and press the **Right** button to confirm. The SonicWALL security appliance changes to SafeMode.

The Test light starts blinking when the SonicWALL security appliance has rebooted into SafeMode.

Note: Holding the reset button for two seconds will send a diagnostic snapshot to the console. Holding the reset button for six to eight seconds will reboot the appliance in regular mode.

- 3. Point the Web browser on your computer to **192.168.168.168**. The SafeMode management interface displays.
- 4. If you have made any configuration changes to the security appliance, select the **Create Backup On Next Boot** checkbox to make a backup copy of your current settings. Your settings will be saved when the appliance restarts.
- 5. Click **Upload New Firmware**, and then browse to the location where you saved the SonicOS firmware image, select the file, and click **Upload**.
- 6. Select the boot icon () in the row for one of the following:
 - Uploaded Firmware New! Use this option to restart the appliance with your current configuration settings.
 - Uploaded Firmware with Factory Defaults New!
 - Use this option to restart the appliance with default configuration settings.
- 7. In the confirmation dialog box, click **OK** to proceed.
- 8. After successfully booting the firmware, the login screen is displayed. If you booted with factory default settings, enter the default user name and password (admin / password) to access the SonicWALL management interface.

Related Technical Documentation

SonicWALL user guides and reference documentation is available at the SonicWALL Technical Documentation Online Library: <u>http://www.sonicwall.com/us/Support.html</u>

For basic and advanced deployment examples, refer to SonicOS Guides and SonicOS TechNotes available on the Website.
